

Supplemental Figure 1

Supp. Figure 1. Response of individuals who were negative (blue bars) or positive (red bars) for RPR to cadaverine aminated beads bound to carboxyl cardiolipin. Sera from a normal RPR negative individual (blue bars) and sera from a syphilis positive, RPR positive individual (red bars) were run at four different dilutions with cardiolipin coated beads looking for IgM and IgG responses. Poly-L-lysine aminated beads (not shown) had similar results. Results shown are representative of N=12 RPR-positive specimens tested.
